

Advanced Load Management Switch

FPF1504 / FPF1504L

Description

The FPF1504/FPF1504L are low- R_{DS} P-channel MOSFET load switches of the IntelliMAX™ family. Integrated slew-rate control prevents excessive inrush current from the supply rails with capacitive loads common in power applications. In addition, the FPF1504/FPF1504L feature output discharge capability.

The input voltage range operates from 1.0 V to 3.6 V to fulfill today's mobile device supply requirements. Switch control is by a logic input (ON pin) capable of interfacing directly with low-voltage CMOS control signals and GPIOs in embedded processors.

Features

- 1.0 V to 3.6 V Input Voltage Operating Range
- Typical $R_{DS(ON)}$:
 - ◆ 15 mΩ at $V_{IN} = 3.3$ V
 - ◆ 20 mΩ at $V_{IN} = 1.8$ V
 - ◆ 40 mΩ at $V_{IN} = 1.0$ V
- Slew Rate Control
- Output Discharge Function
- Low <1 μA Quiescent Current at $V_{ON} = V_{IN}$
- ESD Protected: 4000 V HBM, 2000 V CDM
- GPIO/CMOS-Compatible Enable Circuitry
- Active HIGH and active LOW versions

Applications

- Mobile Devices and Smart Phones
- Portable Media Devices
- Digital Cameras
- Advanced Notebook, UMPC, and MID
- Portable Medical Devices
- GPS and Navigation Equipment

APPLICATION INFORMATION

Input Capacitor

IntelliMAX switches don't require an input capacitor. To reduce device inrush current, a 0.1 μ F ceramic capacitor, C_{IN} , is recommended close to the VIN pin. A higher value of C_{IN} can be used to further reduce the voltage drop experienced as the switch is turned on into a large capacitive load.

Output Capacitor

IntelliMAX switches work without an output capacitor. If the applications parasitic board inductance forces V_{OUT} below GND when switching off, a 0.1 μ F capacitor, C_{OUT} , should be placed between V_{OUT} and GND.

Fall Time

Device output fall time can be calculated based on RC constant of external components as follows:

$$t_F = R_L \times C_L \times 2.2 \quad (\text{eq. 1})$$

where t_F is 90% to 10% fall time, R_L is output, load and C_L is output capacitor.

The same equation works for a device with a pull-down output resistor, then R_L is replaced by a parallel connected pull-down and external output resistor combination, as follows:

$$t_F = \frac{R_L \times R_{PD} \times C_L}{R_L + R_{PD}} \times 2.2 \quad (\text{eq. 2})$$

where t_F is 90% to 10% fall time, R_L is output load, R_{PD} is output pull-down resistor (65 Ω typical), and C_L is the output capacitor.

RECOMMENDED LAND PATTERN AND LAYOUT

For best thermal performance and minimal inductance and parasitic effects, it is recommended to keep input and output traces short and the capacitors as close to the device

as possible. Below is a recommended layout for this device to achieve optimum performance.
