

**SERIES:** PRMC1-S | **DESCRIPTION:** DC-DC CONVERTER

**FEATURES**

- 1 W isolated output
- smaller package
- single/dual regulated outputs
- 3,000 Vdc isolation
- continuous short circuit protection
- temperature range (-40~105°C)
- high efficiency at light load
- efficiency up to 81%
- EN, BS EN 62368-1 certified

| MODEL                        | input voltage |             | output voltage<br>(Vdc) | output current |          | output power<br>max (W) | ripple and noise <sup>1</sup><br>max (mVp-p) | efficiency<br>typ (%) |

| PRMC1-D48-D15-S | 48            | 36~75       | ±15            | ±2             | ±33      | 1            | 100                           | 80         |

Notes: 1. ripple and noise are measured at 20 MHz BW by "parallel cable" method with 1 µF ceramic and 10 µF electrolytic capacitors on the output.  
2. Model is not CE certified.

| R                                       | Follows: $R = \frac{V_C - V_D - 1.0}{I_C} - 300$ |              |              |              |
| Cd                                      | 47nF/100V                                        | 47nF/100V    | 47nF/100V    | 47nF/100V    |

Note: Figure 1-c is on/off control circuit. See page 6 for details.

## TEST CONFIGURATION

Table 2

| External components |                              |
|---------------------|------------------------------|
| Lin                 | 4.7μH                        |
| Cin                 | 220μF, ESR < 1.0Ω at 100 KHz |

Note: Input reflected-ripple current is measured with an inductor Lin and Capacitor Cin to simulate source impedance.

## APPLICATION NOTES

### 1. Output load requirement

To ensure this module can operate efficiently and reliably, the minimum output load may not be less than 5% of the full load during operation. If the actual output power is low, connect a resistor at the output end in parallel to increase the load.

### 2. Recommended circuit

This series has been tested according to the following recommended testing circuit before leaving the factory. This series should be tested under load (see Figure 3 and Table 3). If you want to further decrease the input/output ripple, you can increase the capacitance accordingly or choose capacitors with low ESR. However, the capacitance of the output filter capacitor must be appropriate. If the capacitance is too high, a startup problem might arise. For every channel of the output, to ensure safe and reliable operation, the maximum capacitance must be less than the maximum capacitive load (see Table 4).

Figure 3

Table 3

| Vin (Vdc) | Cin1 (μF) | Cin2 (μF) | Lin (μH) | Cs <sup>1</sup> (μF) | Cout (μF) | Lout <sup>2</sup> (μH) | Cd (nF/V) |
|-----------|-----------|-----------|----------|----------------------|-----------|------------------------|-----------|
| 5         | 100       | 47        | 4.7~12   | 10~22                | 100       | 2.2~10                 | 47/100    |
| 12        | 100       | 47        | 4.7~12   | 10~22                | 100       | 2.2~10                 | 47/100    |
| 24        | 10        | 1         | 4.7~12   | 10~22                | 100       | 2.2~10                 | 47/100    |
| 48        | 10        | 1         | 4.7~12   | 10~22                | 100       | 2.2~10                 | 47/100    |

Note: 1. For single output only  
2. For dual output only

Table 4

| Single Vout (Vdc) | Max. Capacitive Load (μF) | Dual Vout (Vdc) | Max. Capacitive Load <sup>1</sup> (μF) |
|-------------------|---------------------------|-----------------|----------------------------------------|
| 3.3               | 2700                      | --              | --                                     |
| 5                 | 2200                      | 5               | 1000                                   |
| 9                 | 1800                      | --              | --                                     |
| 12                | 1000                      | 12              | 470                                    |
| 15                | 680                       | 15              | 330                                    |
| 24                | 470                       | --              | --                                     |

Note: 1. For each output.

### 3. CTRL Terminal

When open or applied high impedance, the converter will turn on. When it's pulled high, the converter will shutdown. The input current should be between 5~10mA. Exceeding the maximum 20mA will cause permanent damage to the converter. The value for R can be derived as follows:

$$R = \frac{V_C - V_D - 1.0}{I_C} - 300$$

$V_C$ : Control pin input voltage

$V_D$ : Forward voltage drop of diode D1

$I_C$ : Input current to control pin

R: Resistor of control circuit

Figure 4

### 4. Input Current

When it is used in an unregulated condition, make sure that the input fluctuations and ripple voltage do not exceed the module standard. Refer to Figure 5 and Table 5 for the startup current of this dc-dc module.

Figure 5

Table 5

| Vin (Vdc) | Ip (mA) |
|-----------|---------|
| 5         | 450     |
| 12        | 220     |
| 24        | 110     |
| 48        | 55      |

Note: 1. Minimum load shouldn't be less than 5%, otherwise ripple may increase dramatically. Operation under minimum load will not damage the converter, however, they may not meet all specifications listed.  
2. Maximum capacitive load is tested at input voltage range and full load.  
3. All specifications are measured at Ta=25°C, humidity<75%, nominal input voltage and rated output load unless otherwise specified.

## REVISION HISTORY

| rev. | description                                               | date       |
