Product Description

The CM2006 connects between the VGA or DVI−I port connector and the internal analog or digital flat panel controller logic. The CM2006 incorporates ESD protection for all signals, level shifting for the DDC signals and buffering for the SYNC signals. ESD protection for the video, DDC and SYNC lines is implemented with low−capacitance current steering diodes.

All connector interface pins are designed to safely handle the high current spikes specified by IEC−61000−4−2 Level 4 (±8 kV contact discharge). The ESD protection for the DDC, SYNC and VIDEO signal pins is designed to prevent “backdrive current” when the device is powered down while connected to a video source that is powered up.

Separate positive supply rails are provided for the VIDEO / SYNC signals and DDC signals to facilitate interfacing with low voltage video controller ICs and microcontrollers to provide design flexibility in multi−supply−voltage environments.

Two Schmitt−triggered non−inverting buffers redrive and condition the HSYNC and VSYNC signals from the video connector (SYNC1, SYNC2). These buffers accept VESA VSIS compliant TTL input signals and convert them to CMOS output levels that swing between ground and V_{CC}.

Two N−channel MOSFETs provide the level shifting function required when the DDC controller or EDID EEPROM is operated at a lower supply voltage than the monitor. The gate terminals for these MOSFETS (V_{CC_DDC}) should be connected to the supply rail (typically 3.3 V, 2.5 V, etc.) that supplies power to the transceivers of the DDC controller.

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

1. All parameters specified over standard operating conditions unless otherwise noted.
2. These parameters apply only to the SYNC drivers. Note that $R_{OUT} = R_T + R_{BUFFER}$.
3. Per the IEC−61000−4−2 International ESD Standard, Level 4 contact discharge method. BYP and V_{CC} must be bypassed to GND via a low impedance ground plane with a 0.22 μF, low inductance, chip ceramic capacitor at each supply pin. ESD pulse is applied between the applicable pins and GND. ESD pulses can be positive or negative with respect to GND. Applicable pins are: VIDEO_1, VIDEO_2, VIDEO_3, SYNC_IN1, SYNC_IN2, DDC_IN1 and DDC_IN2. All pins are ESD protected to the industry standard ±2 kV Human Body Model (MIL−STD−883, Method 3015).
4. This specification applies to the SYNC_OUT pins only.
5. Applicable pins are: VIDEO_1, VIDEO_2, VIDEO_3, SYNC_IN1, SYNC_IN2, DDC_IN1 and DDC_IN2.

APPLICATION INFORMATION

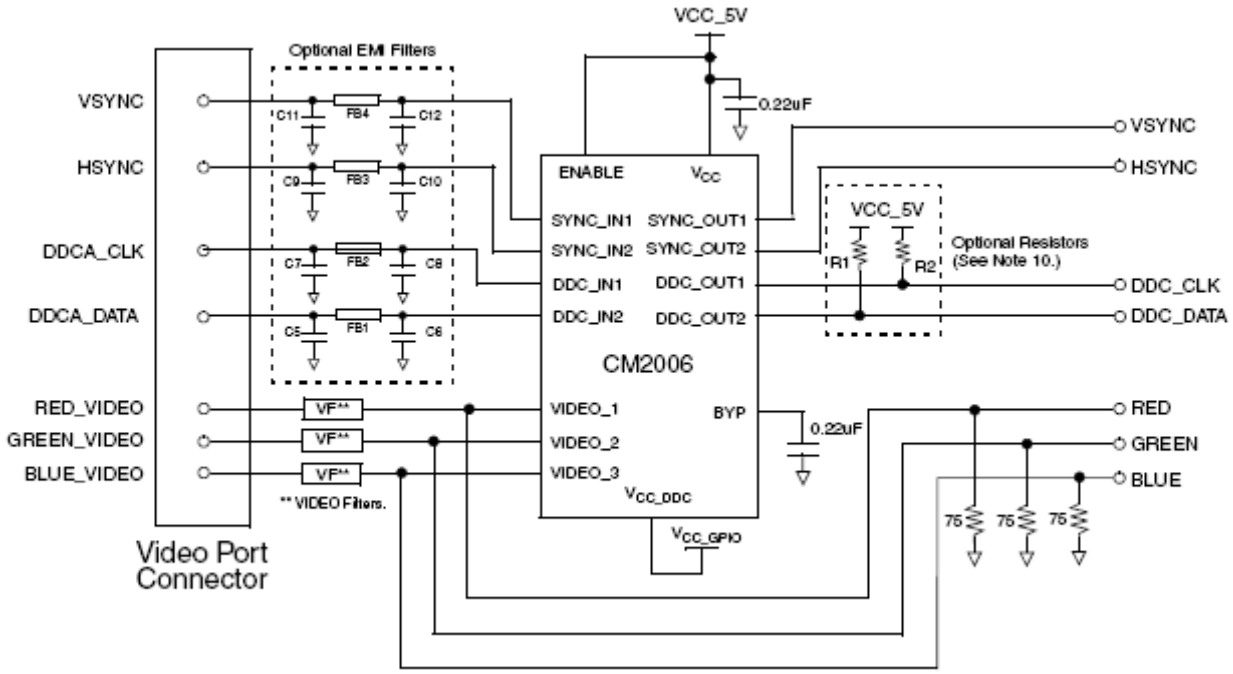

Figure 1. Typical Application Connection Diagram

NOTES:

1. The CM2006 should be placed as close to the VGA or DVI−I connector as possible.
2. The ESD protection channels VIDEO_1, VIDEO_2, VIDEO_3 may be used interchangeably between the R, G, B signals.
3. If differential video signal routing is used, the RED, BLUE, and GREEN signal lines should be terminated with external 37.5 Ω resistors.
4. “VF” are external video filters for the RGB signals.
5. Supply bypass capacitors C1 and C2 must be placed immediately adjacent to the corresponding Vcc pins. Connections to the Vcc pins and ground plane must be made with minimal length copper traces (preferably less than 5 mm) for best ESD protection.
6. The bypass capacitor for the BYP pin has been omitted in this diagram. This results in a reduction in the maximum ESD withstand voltage at the DDC_OUT pins from ±8 kV to ±2 kV. If 8 kV ESD protection is required, a 0.22 μF ceramic bypass capacitor should be connected between BYP and ground.
7. The SYNC buffers may be used interchangeably between HSYNC and VSYNC.
8. The EMI filters at the SYNC_OUT and DDC_OUT pins (C5 to C12, and Ferrite Beads FB1 to FB4) are for reference only. The component values and filter configuration may be changed to suit the application.
9. The DDC level shifters DDC_IN, DDC_OUT, may be used interchangeably between DDCA_CLK and DDCA_DATA.
10. R1, R2 are optional. They may be used, if required, to pull the DDC_CLK and DDC_DATA lines to VCC_5V when no VGA card is connected to the VGA monitor. If used, it should be noted that “back current” may flow between the DDC pins and VCC_5V via these resistors when VCC_5V is powered down.
